# VIVARI AESTHETICS

The Vivari Aesthetics Institute of Surgical Excellence is a specialised cosmetic surgery facility that combines expert surgical procedures with five-star boutique hospitality.

Vivari Aesthetics is a specialised cosmetic hospital and clinic in Featherbrooke, Johannesburg, South Africa. It is the brainchild of Dr Anushka Reddy, a medical doctor and owner of Medi-Sculpt, a specialised non-invasive cosmetic and anti-ageing clinic that is also on the same property. Dr Reddy's vision is to provide a luxurious and tranquil environment for patients to have their aesthetic procedures done with an option to stay over and be cared for by qualified health professionals post-surgery. The facilities of the hotel are available to them to enjoy.

These facilities have redefined beauty and wellness by combining luxury accommodation with a luxury day spa, a non-invasive aesthetic clinic, as well as a hospital and clinic all on the same property. This offers patients, a private and secure location for a getaway, treatments and ultimately cosmetic procedures in a luxurious and serene setting for recovery.

The facility offers state-of-the-art equipment and fully qualified medical staff, ensuring that our Patients are well looked after pre- and post-surgery, particularly if they choose to stay over post-surgery. The medical staff will be able to provide the patients with the necessary post-surgery care they require while they recover in the hotel.

The cosmetic surgery has a state-of-the-art operating theatre with 5 post-surgical day beds. Accommodation for patients who choose to recuperate at the hotel is directly above the wards with a lift for convenient and easy access to and from the hotel rooms.

## CONSULTATION

At Vivari Aesthetics we want to ensure that our patients are well informed and receive professional and trusted advice about their chosen procedures before the day of the procedure. For this reason we have set aside specific days for surgeons to consult with them and respond to any of their queries which will ensure that their chosen procedures are indeed what they require.

We will also provide consultations via Skype for patients who are not able to come in for face-to-face consults.

## NOSE JOB (RHINOPLASTY)

### OVERVIEW

Rhinoplasty (RIE-no-plas-tee) is surgery that changes the shape of the nose. The motivation for rhinoplasty may be to change the appearance of the nose, improve breathing or both.

The upper portion of the structure of the nose is bone, and the lower portion is cartilage. Rhinoplasty can change bone, cartilage, skin or all three. Talk with your surgeon about whether rhinoplasty is appropriate for you and what it can achieve.

When planning rhinoplasty, your surgeon will consider your other facial features, the skin on your nose and what you would like to change. If you're a candidate for surgery, your surgeon will develop a customized plan for you.

Sometimes part or all of a rhinoplasty is covered by insurance.

### CONSULTATION

Before scheduling rhinoplasty, you must meet with your surgeon to discuss important factors that determine whether the surgery is likely to work well for you. This meeting generally includes:

#### MEDICAL HISTORY AND EXAM

The most important question your doctor will ask you is about your motivation for surgery and your goals. Your doctor will also ask questions about your medical history — including a history of nasal obstruction, surgeries and any medications you take. If you have a bleeding disorder, such as hemophilia, you may not be a candidate for rhinoplasty.

#### A PHYSICAL EXAM

Your doctor will conduct a complete physical examination, including any laboratory tests, such as blood tests. He or she also will examine your facial features and the inside and outside of your nose. The physical exam helps your doctor determine what changes need to be made and how your physical features, such as the thickness of your skin or the strength of the cartilage at the end of your nose, may affect your results. The physical exam is also critical for determining the impact of rhinoplasty on your breathing.

### PHOTOGRAPHS

Someone from your doctor's office will take photographs of your nose from different angles. Your surgeon may use computer software to manipulate the photos to show you what kinds of results are possible. Your doctor will use these photos for before-and-after assessments, reference during surgery and long-term reviews. Most importantly, the photos permit a specific discussion about the goals of surgery.

### A DISCUSSION ON YOUR EXPECTATIONS

You and your doctor should talk about your motivations and expectations. He or she will explain what rhinoplasty can and can't do for you and what your results might be. It's normal to feel a little self-conscious discussing your appearance, but it's very important that you're open with your surgeon about your desires and goals for surgery.

If you have a small chin, your surgeon may speak with you about performing a surgery to augment your chin. This is because a small chin will create the illusion of a larger nose. It's not required to have chin surgery in those circumstances, but it may better balance the facial profile.

Once the surgery is scheduled, you'll need to arrange for someone to drive you home if you're having an outpatient surgery. For the first few days after anesthesia, you may have memory lapses, slowed reaction time and impaired judgment. So arrange for a family member or friend to stay with you a night or two to help with personal care tasks as you recover from surgery.

## HOW TO PREPARE FOR A RHINOPLASTY?

### FOLLOW MEDICATION DIRECTIONS

#### FOOD AND MEDICATIONS

Avoid medications containing aspirin or ibuprofen for two weeks before and after surgery. These medications may increase bleeding. Take only those medications approved or prescribed by your surgeon. Also avoid herbal remedies and over-the-counter supplements.

If you smoke, stop smoking. Smoking slows the healing process after surgery and may make you more likely to get an infection.

### ARRANGE FOR HELP DURING RECOVERY

If your Rhinoplasty is done as an outpatient, make plans for someone to drive you home after surgery and stay with you the first night after surgery.

# VIVARI AESTHETICS

## DURING THE PROCEDURE

Rhinoplasty requires local anesthesia with sedation or general anesthesia, depending on how complex your surgery is and what your surgeon prefers. Discuss with your doctor before surgery which type of anesthesia is most appropriate for you.

- Local anesthesia with sedation. This type of anesthesia is usually used in an outpatient setting. It's limited to a specific area of your body. Your doctor injects a pain-numbing medication into your nasal tissues and sedates you with medication injected through an intravenous (IV) line. This makes you groggy but not fully asleep.
- General anesthesia. You receive the drug (anesthetic) by inhaling it or through a small tube (IV line) placed in a vein in your hand, neck or chest. General anesthesia affects your entire body and causes you to be unconscious during surgery. General anesthesia requires a breathing tube.
- Rhinoplasty may be done inside your nose or through a small external cut (incision) at the base of your nose, between your nostrils. Your surgeon will likely re-adjust the bone and cartilage underneath your skin.
- Your surgeon can change the shape of your nasal bones or cartilage in several ways, depending on how much needs to be removed or added, your nose's structure, and available materials. For small changes, the surgeon may use cartilage taken from deeper inside your nose or from your ear. For larger changes, the surgeon can use cartilage from your rib, implants or bone from other parts of your body. After these changes made, the surgeon places the nose's skin and tissue back and stitches the incisions in your nose.
- If the wall between the two sides of the nose (septum) is bent or crooked (deviated), the surgeon can also correct it to improve breathing.
- After the surgery, you'll be in a recovery room, where the staff monitors your return to wakefulness. You might leave later that day or, if you have other health issues, you might stay overnight.

## AFTER THE PROCEDURE

After the surgery you need to rest in bed with your head raised higher than your chest, to reduce bleeding and swelling. Your nose may be congested because of swelling or from the splints placed inside your nose during surgery.

In most cases, the internal dressings remain in place for one to seven days after surgery. Your doctor also tapes a splint to your nose for protection and support. It's usually in place for about one week.

Slight bleeding and drainage of mucus and old blood are common for a few days after the surgery or after removing the dressing. Your doctor may place a "drip pad" — a small piece of gauze held in place with tape — under your nose to absorb drainage. Change the gauze as directed by your doctor. Don't place the drip pad tight against your nose.

To further lower the chances of bleeding and swelling, your doctor may ask that you follow precautions for several weeks after surgery. Your doctor may ask you to:

- Avoid strenuous activities such as aerobics and jogging.
- Take baths instead of showers while you have bandages on your nose.
- Not blow your nose.
- Eat high-fiber foods, such as fruits and vegetables, to avoid constipation. Constipation can cause you to strain, putting pressure on the surgery site.
- Avoid extreme facial expressions, such as smiling or laughing.
- Brush your teeth gently to limit movement of your upper lip.
- Wear clothes that fasten in the front. Don't pull clothing, such as shirts or sweaters, over your head. to prevent pressure on your nose. You can use cheek rests or tape the glasses to your forehead until your nose has healed.
- Use SPF 30 sunscreen when you're outside, especially on your nose. Too much sun may cause permanent irregular discoloration in your nose's skin.

Some temporary swelling or black-and-blue discoloration of your eyelids can occur for two to three weeks after nasal surgery. Swelling of the nose takes longer to resolve. Limiting your dietary sodium will help the swelling go away faster. Don't put anything such as ice or cold packs on your nose after surgery.

Your nose changes throughout your life whether you have surgery or not. For this reason, it's difficult to say when you have obtained your "final result." However, most of the swelling is gone within a year.

In addition, don't rest eyeglasses or sunglasses on your nose for at least four weeks after the surgery.

# VIVARI AESTHETICS

## RESULTS

Very slight changes to the structure of your nose – often measured in millimeters – can make a large difference in how your nose looks. Most of the time, an experienced surgeon can get results both of you are satisfied with. But in some cases, the slight changes aren't enough, and you and your surgeon might decide to do a second surgery for further changes. If this is the case, you must wait at least a year for the follow-up surgery, because your nose can go through changes during this time.

## HOW LONG IS THE RECOVERY PERIOD?

Plan to take a week off from work, school or other obligations. You will feel progressively better each day during the first week. One week after surgery, people usually feel like they are themselves again.

After surgery, there will be some swelling. The swelling can take many months to resolve, although most people stop noticing it after a couple of months. People are usually back to performing most activities after a week and resuming all activities after two to four weeks.

# VIVARI OVERNIGHT PACKAGES

OPTIONAL PACKAGES FOR HOTEL, RESTAURANT AND SPA	
REFRESH	One night full board basis with nurse care cover, inclusive of 1 hour Classic Body Ritual at Vivari Spa.*
REVIVE	Two nights full board basis with nurse care cover, inclusive of 1 hour Classic Body Ritual at Vivari Spa.*
RENEW	Three nights full board basis with nurse care cover, inclusive of 1 hour Classic Body Ritual at Vivari Spa.*
<i>* Please note that packages exclude incidentals like drinks and any additional spa treatments.</i>
